

Dept Number	CS 408		Course Title	Applied Cryptography						
Semester Hours	3		Course Coordinator	Bidyut Gupta						
			SP15							
Catalog Description	This course is a comprehensive introduction to modern cryptography, with an emphasis on the application and implementation of various techniques for achieving message confidentiality, integrity, authentication and non-repudiation. Applications to Internet security and electronic commerce will be discussed. All background mathematics will be covered in the course.									
Textbooks										
SP17										
<u>Cryptography & Network Security</u> , William Stallings, 6 th Edition, 2014, PH Publications, ISBN: 9780133354690.										
<u>Cryptography & Network Security</u> , William Stallings, 6 th Edition, 2014, PH Publications, ISBN: 9780133559682

Course Learning Outcomes										
<ul style="list-style-type: none"> • To understand the design principles of modern cryptographic algorithms. • To learn a variety of cryptanalytic and side-channel attacks. • To understand how cryptography is deployed in practice, with an emphasis on its application in network security. • To learn how to implement cryptographic algorithms with symbolic computation software. 										
Assessment of the Contribution to Student Outcomes										
SP17										
Outcome →	1	2	3	4	5	6	7	8	9	10
Assessed →	X	X	X	X	X	X				

Prerequisites by Topic		
CS 330 with a grade of C or better and MATH 221.		
CS 408	Applied Cryptography	Page 2
Major Topics Covered in the Course		
<ol style="list-style-type: none">1. Symmetric-key encryption: classical ciphers, one-time pad, stream ciphers (RC4), Feistel networks, DES, AES, modes of operation {8 classes}2. Message integrity: hash functions, Merkle's Meta method, parallel collision search, message authentication codes (CBC-MAC, HMAC) {5 classes}3. Key escrow and secret sharing {2 classes}4. Public-key encryption: RSA, ElGamal, padding schemes, semantic security {9 classes}5. Signature schemes: RSA, DSA, ECDSA {3 classes}6. Pseudorandom bit generation: random bit generation, cryptographically strong pseudorandom bit generators, Yao's Theorem {2 classes}7. Key establishment and management: key distribution centers, Diffie-Hellman and station-to-station key agreement, Merkle authentication trees, certificate authorities, public key infrastructures {3 classes}8. Deployed cryptography: Kerberos, PGP, SSL/TLS, WEP/WPA, digital payment systems (SET, e-cash, micropayments), electronic voting {6 classes}9. Selected advanced topics: zero-knowledge proofs, strong password protocols (EKE/STP), identity-based encryption, broadcast encryption, oblivious transfer {2 classes}
